Figure S 10: Missing ADA and IFX prescriptions dates' imputation algorithm:

- If previous and following prescriptions dates were available, then:
 - If the midpoint between the previous and next prescription dates occurs during the month of the current prescription, then missing prescription date will be imputed by the midpoint of the dates
 - Else (i.e. the midpoint between the previous and following prescription does not correspond to the month of current prescription) the 15th of the month provided in the database will be used
- If the next prescription date only is available, then missing date will be calculated as the difference between next date and the interval defined in the package insert (56 days for IFX/ number of syringes prescribed * 14 days for ADA)
 - but if the calculated month was different from the month provided in the database, then
 - if the next prescription is not in the same month as current prescription, then the 15th of the month provided in the database will be used
 - If the next prescription occurs in the same month as current prescription, then it will be assumed that the current prescription occurs on the first of the month
- If the previous prescription is only available, then missing date will be calculated as the sum of previous date and the interval defined in the package insert (56 days for IFX/ number of syringes prescribed * 14 days for ADA)
 - but if the calculated month was different from the month provided in the database, then
 - if the previous prescription was not in the same month as current prescription, the 15th of the month provided in the database will be used
 - If the previous prescription occurs in the same month as current prescription, it will be assumed that current prescription occurs on the last day of the month
- If no date was available for the patient then the 15th of the month will be used.
