Age: years. Sex: F, female; M, male. Comorbidities: HT, hypertension; HC, hypercholesterolemia; DM, diabetes mellitus. Trigger: RF, radiofrequency; PVI, pulmonary vein isolation. Presenting symptoms: Resp distress, respiratory distress; Card shock, cardiogenic shock; VT/VF, ventricular tachycardia/fibrillation. ECG: Neg T, negative T-waves; STE, ST elevations; LBBB, left bundle branch block; STD, ST depressions. Max TnT, maximal troponin T value (ng/ml; cut-off value 0.035). Echocardiography: LVEF, LV ejection fraction (%); IVS, interventricular septum (mm; septal bulge if ≥ 12 mm). LVOT_{grad}, left ventricular outflow tract gradient (mmHg); SAM, systolic anterior motion of the anterior mitral valve leaflet; MR, mitral regurgitation grade on a scale of 4. Therapy: Inotrop, inotropics i.v.; BBL, beta-bocker i.v.; IABP, intra-aortic balloon pump. Time to LVEF recup, LVEF recuperation = LVEF $\geq 55\%$ (days). [#] LVEF as calculated on LV angiogram (and confirmed on transthoracic echocardiography).
