All patients undergoing coronary angiography (CAG) or PCI (2010 - 2012) (N=3237)

Excluded(n=1957)

CABG（n=27）

Previous PCI or Previous MI（n=345）;

Acute MI or Emergent PCI（1112）

Lack data of one of Framingham traditional risk variables （age, gender, CHO, HLD-C, SBP, DBP, smoke）（545）

Lack complete data of CAG (304)

Included study population (n=1262)
With reliable Framingham risk variables and CAG data, in the cohort without known CAD referred for elective CAG

The primary endpoint :
obstructive coronary artery disease (OCAD) was defined as ≥50% stenosis in at least 1 major coronary vessel according to CAG.
