¹ Use of screening method for calculation of VE; serious ROB

² Crude estimate only, because screening method was used.

³ Cannot be calculated since screening method was used

⁴ Both rated as moderate RoB.

⁵ Wide range of effect estimates in the studies

⁶ Case-control study with lowest risk of bias (Saul et al.) was used here. One additional case-control study (Skoff et al.) and one cohort study (Becker-Dreps et al.) had higher risk of bias.

⁷ Largest cohort study with control group for this outcome (based on VSD data; Kharbanda, 2016)

⁸ RoB was rated serious because only an unadjusted estimate was reported.

⁹ Crude ratio effect estimate (95% CI); authors do not present adjusted results, only for composite outcome

¹⁰ Three cohort studies (Kharbanda et al., Berenson et al., Griffith et al.) with confounder-adjusted estimates.

¹¹ All 3 were rated serious risk of bias.

¹² Adjusted effects varied and partly included 1.0

¹³ Serious RoB in all studies due to various categories

¹⁴ Three cohort studies reported confounder-adjusted estimates.

¹⁵ One study with plausible background rate and confounder-adjusted estimate.

¹⁶ 5 cohort studies reported confounder-adjusted estimates.

¹⁷ Two studies with confounder-adjusted estimates.

¹⁸ Only crude estimates reported.

¹⁹ very low case numbers, very wide 95% CIs
