

Fig. S3. The growth of stable transfectant cells harboring an empty vector (IRES), wild-type T β RII (WT), or I227T/N236D T β RII (227-236). The stable cells were cultured in the presence of vehicle (-) or 10 ng/mL of TGF- β 1 (+) for up to 4 days. Cell proliferation was measured by MTT assay. Data represent mean \pm standard deviation. * $P < 0.05$ (mutant vs. wild-type).
