Supplementary information

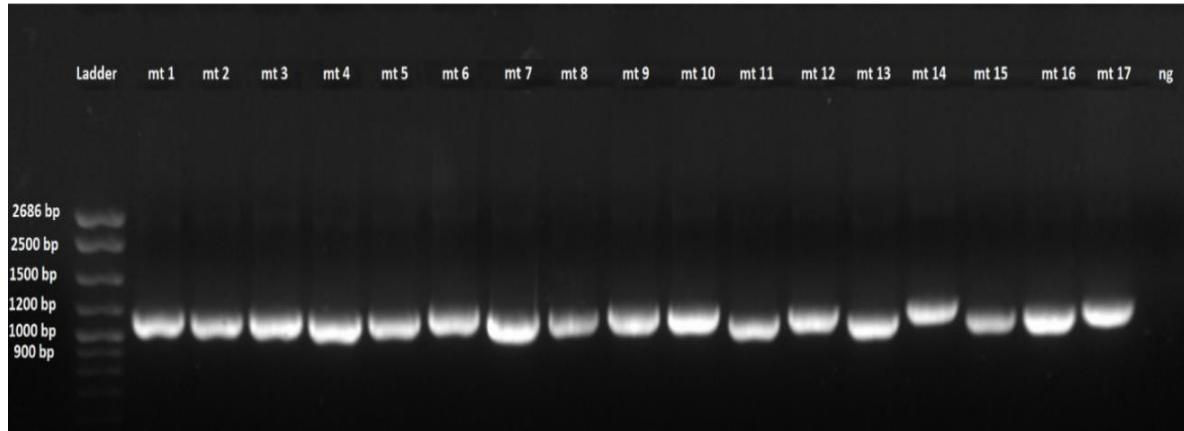

Figure S1. Representative image of agarose gel electrophoresis of PCR products amplified using 17 pairs of primers. This image was obtained from one single gel without any grouping or cropping. mt 1-17: seventeen fragments (~ 1,1 kb each) of mitochondrial genome; ng: negative control.

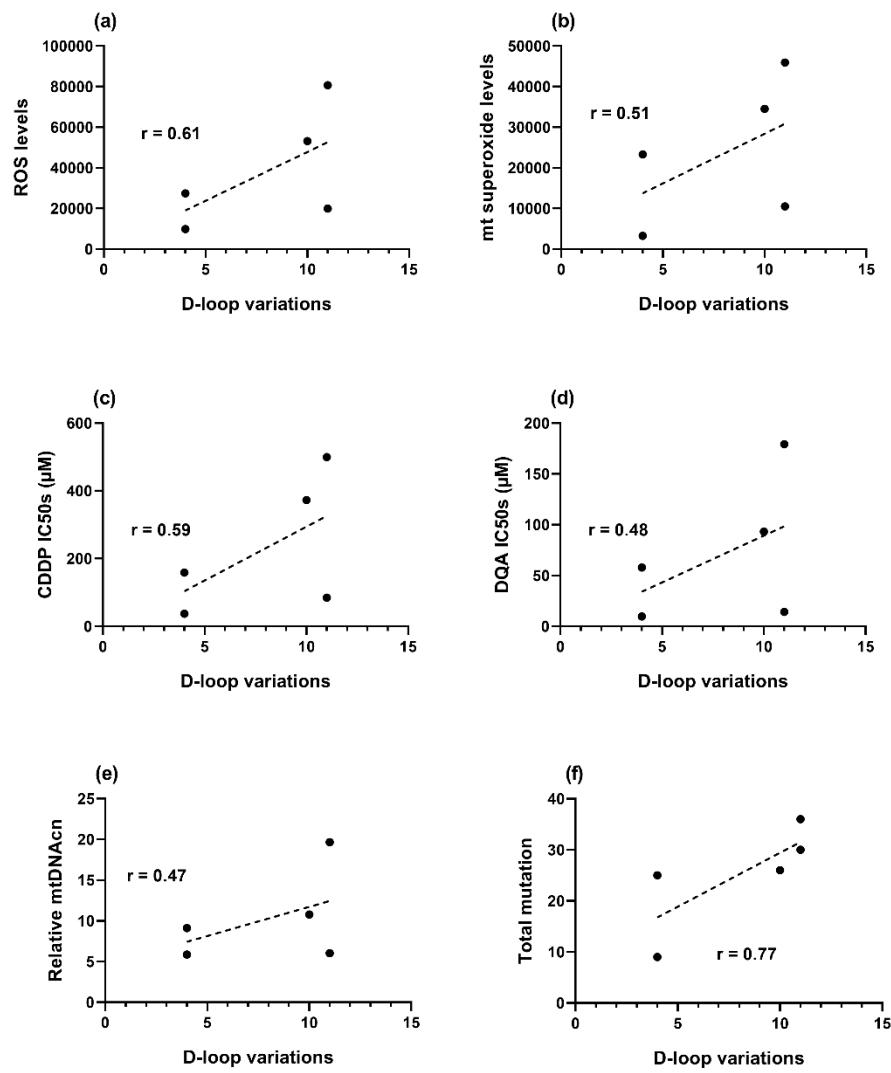

Figure S2. Correlation between the D-loop variations and the baseline intracellular ROS level (a), mitochondrial superoxide level (b), drug resistance against CDDP (c) and DQA (d), relative content of mtDNA (e) and the total number of variations (f). Data points representing the cell lines are in the sequence of PNT-2, Ishikawa, MDA-MB-231, PC-3 and Caco-2. r value was calculated using the Pearson correlation coefficient method.

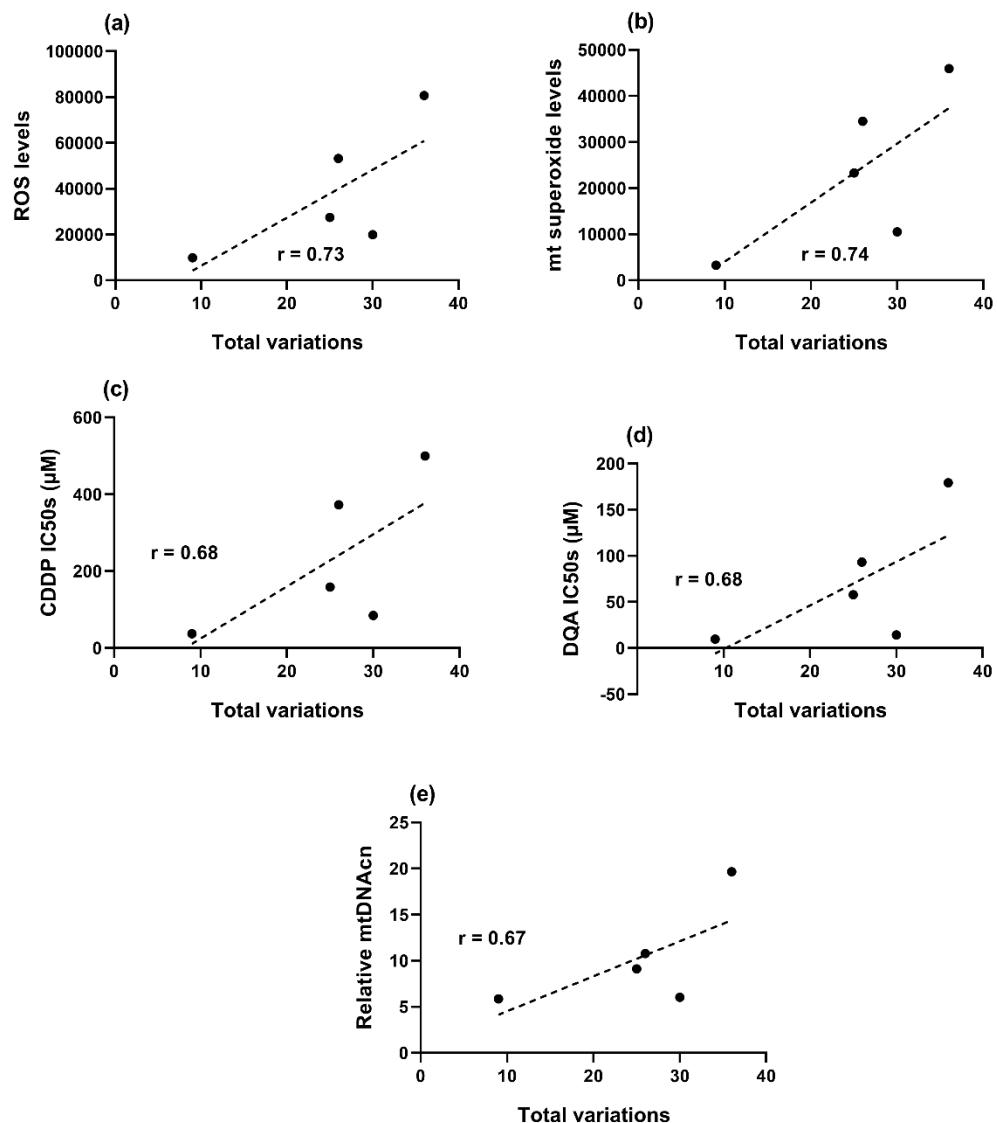

Figure S3. Correlation between the total variations and the baseline intracellular ROS level (a), mitochondrial superoxide level (b), drug resistance against CDDP (c) and DQA (d) and relative content of mtDNA. Data points representing the cell lines are in the sequence of PNT-2, Ishikawa, MDA-MB-231, PC-3 and Caco-2. r value was calculated using the Pearson correlation coefficient method.

Table S1. List of common variations identified in the 5 cell lines.

| Variations | PNT-2 | Ishikawa | MDA-MB-231 | PC-3 | Caco-2 | Region | Variation type | Amino acid change |
