

Figure S5. Expression levels of lncRNAs of the confirmation cohort, in vitreous and plasma (Group B versus Group C). The levels of lncRNAs were determined by qRT-PCR. The data of each group are expressed as the relative expression. The *asterisk* indicates the significant difference. Group B consisted of patients with PDR pretreated with conbercept 3–7 days before surgery; Group C consisted of patients with PDR who underwent surgery alone. qRT-PCR, quantitative real-time polymerase chain reaction; PDR, proliferative diabetic retinopathy.
