

Additional file 4. Comparison of changes in FEV₁% predicted from baseline in HRV-A-positive and HRV-C-positive patients.

Eleven HRV-A-positive and 6 HRV-C-positive patients underwent a PFT 3 months after exacerbations, and FEV₁% predicted from baseline was compared. Values are expressed as the median with an interquartile range. Differences in data were analysed by the Mann–Whitney *U*-test. FEV₁, forced expiratory volume in one second.
