

1. Experiences

What are your reflections on the definition of low-value care? Can you provide some examples of examinations in your practice that will fall under this definition?

Can you tell me about your experience with low-value radiology?

What do you think are the most important reasons for using low-value examinations?

How do you think the following impact on the use of low-value services?

- Economics
- Organisational structures
 - o Systems
 - o Environmental mechanisms (access to services, demands, expectations)
 - o Imaging 'just to be sure'

Have you tried to reduce the use of low-value radiology? If so, what did you do, and how did the measure work?

- How was the measure received?
- Why do you think it worked/ did not work?

2. Possible future measures

In your opinion, what does it take to reduce the use of low-value radiology?

What does it take for the measure to work?

What can make measures unsuccessful?

How do you think the measures will be received, for example by:

- a. Colleagues
- b. Patients/next of kin
- c. Others

3. Elaboration

Is there anything else you think it is important for us to know or that you wish to elaborate?
