

Additional file 1. Proliferation of TGF β 1 induced stromal cells by pirfenidone (A, B) and by nintedanib (C, D). Six samples were analysed and 3 of them were derived from healthy lung (A, C) and 3 from IPF (B, D). Pirfenidone (0.1 mM-1mM) or nintedanib (0.1-1 μ M) was added to the sample together with 5 ng/ml TGF β 1 at the beginning of the experiment. The values were related to the corresponding control.
