

Neighborhood houses visited, screened for children aged 0-5 who were underweight for their age.
At least one child weighing more than 2 standard deviations below weight-for-age norm
(n=788)

Randomized to intervention
(n=536)

Did not receive any follow-up weighings
(n=32)
Child died during course of study
(n=16)

Included in survival analysis models
(n=536)
(Children not weighed censored at 12 months; children who died censored at death)

Randomized to control
(n=252)

Did not receive any follow-up weighings
(n=50)
Child died during course of study
(n=5)

Included in survival analysis models
(n=252)
(Children not weighed censored at 12 months; children who died censored at death)
