

Human Glioblastoma Tissue Microarray Galectin-1 Immunostain

Arranged by intensity of stain

Supplemental Figure 1 . Galectin-1 staining correlates with patient survival. Using a tissue microarray created at Mayo Clinic, we stained glioblastoma samples from 34 separate patients using immunohistochemistry for galectin-1. A survival analysis revealed a trend towards shorter survival in those patients harboring galectin-1 positive tumors.

Median Survival

Galectin-1 staining: 8.4 mos.

No galectin-1 staining: 13.4 mos.

$p = 0.0793$ (LogRank)
