

Supplemental Figure 1. Effects of rhPRL on synoviocyte proliferation

K4IM synoviocytes (A) and RA-HFLS (B) were cultured in serum-free basal media or growth media containing 10% FBS alone or with rhPRL (10-1000ng/mL) for 96 hours. Cell growth and viability was measured using the Promega CellTiter 96 cell proliferation assay and absorbance at 570nm was recorded.
