

**Additional file 2. The final factors used for ANOVA analyses.**

Words in italics are the factor names according to the property the factor measures. All numerals indicate concentration in  $\mu\text{mol/L}$  except for ristocetin where the unit of concentration is  $\text{mg/mL}$ . Semicolons separate different concentrations of the same agonist. Crossed out variables were initially part of the respective factors but later on excluded for different reasons (see text). Abbreviations are as follows: ADP = adenosine 5'-diphosphate, Adr = adrenaline, Risto = ristocetin, LPA = lysophosphatidic acid, CRP = C-reactive protein.
