Performance of mice in training phase of fear conditioning

The freezing time in training phase of fear conditioning showed no significant difference among the groups (Figure. one-way ANOVA, $F=8.564$, n=42, $p=0.110$), indicating the equivalent baseline of learning and memory of mice groups.

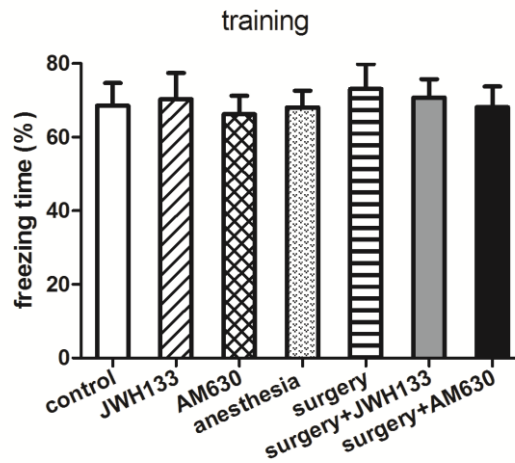

Figure. All mice groups showed no significant difference in freezing time of training phase of fear conditioning. Data are plotted as mean ± standard error of the mean for each group (n=6 per group).
