

Gaussian Mixture Model

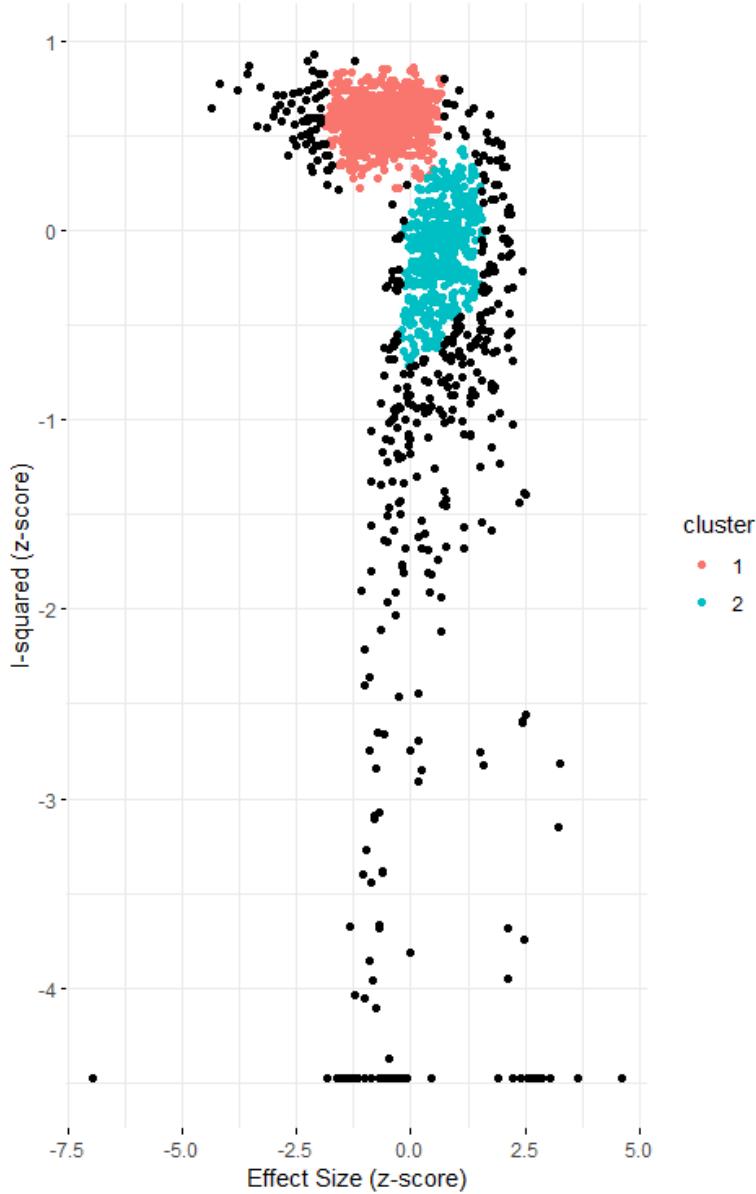

Cluster imbalance (GMM)

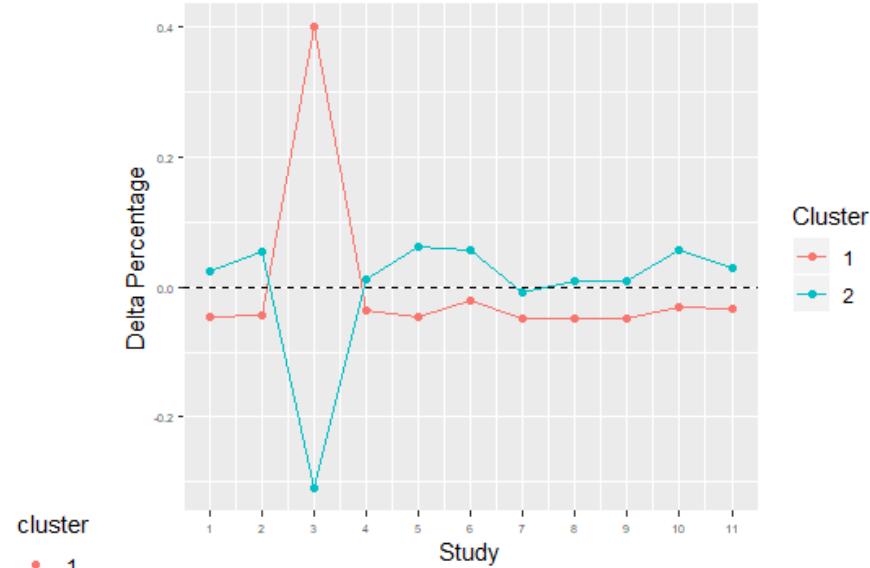

Cluster imbalance (Cook's Distance)

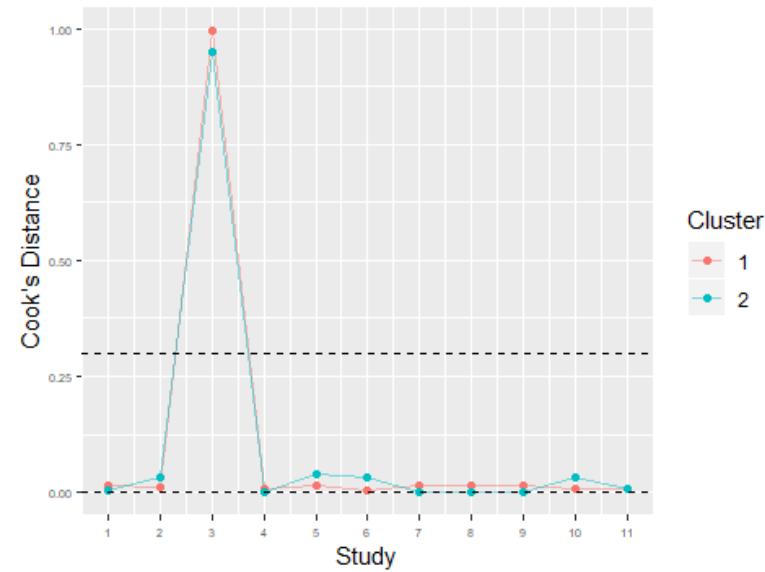

DBSCAN Algorithm (black dots are outliers)

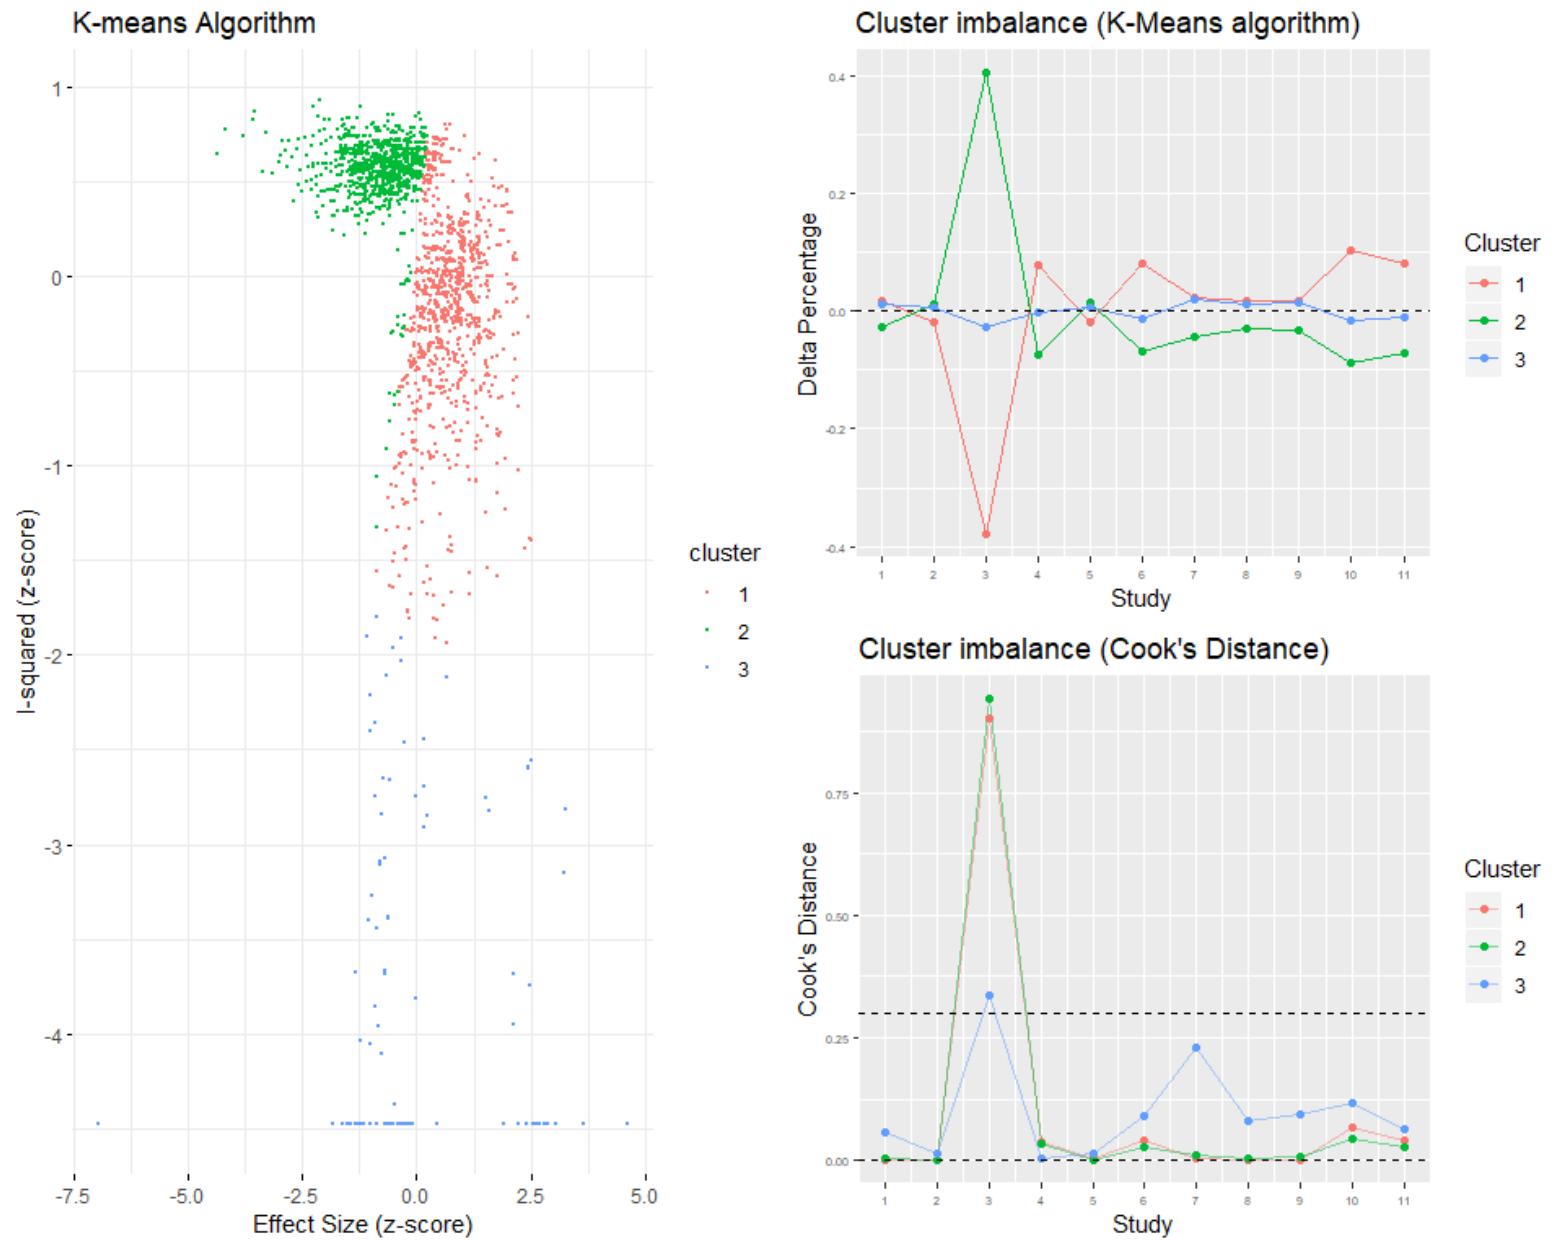

Cluster imbalance (Density-Based Clustering)

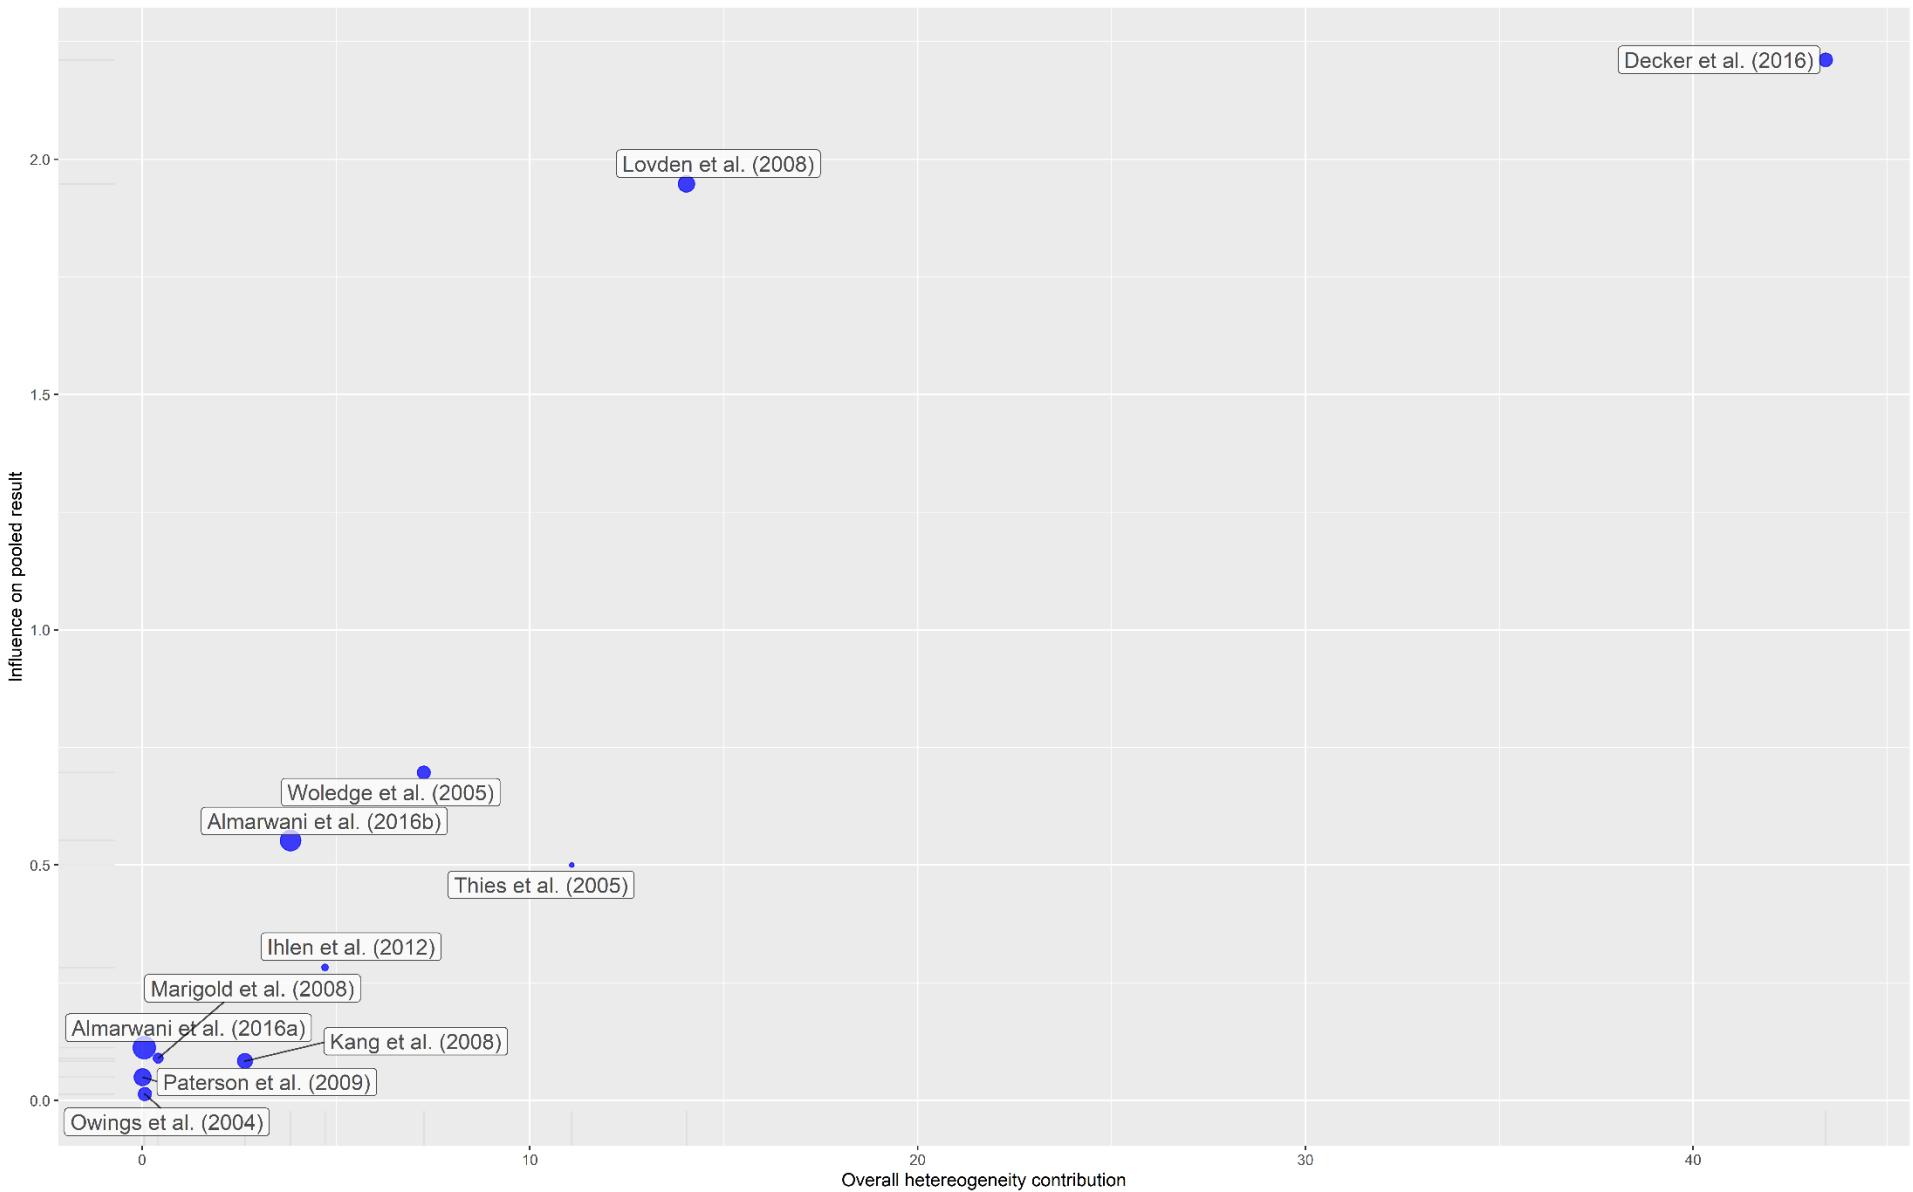

Cluster imbalance (Cook's Distance)

Additional Figures 1-3: To explore the patterns of the pooled effect sizes and heterogeneity we used the GOSH plot. The GOSH plot displays the pooled effect sizes of every possible subset ($2^{10}-1$) of the included studies in the meta-analysis against I^2 . Three clustering algorithms (k-means, DBSCAN and the Gaussian Mixture Model) was used to detect clusters in the GOSH plot data and determine which of the studies contribute the most to the cluster imbalance.

Additional Figure 4: Baujat plot showing the influence of each study on the overall Q statistic on the horizontal axis and its influence on the pooled effect size on the vertical axis

Additional Table 1. Heterogeneity sensitivity analysis. The leave-one-out-method recalculates the results of the meta-analysis by omitting one study at time.

Study	Author	ES	95% CI	I^2	rstudent	DFFITS	cook.d	cov.r	τ^2	QE.del	hat	weight	infl
