

RBE4-WT

Additional file 7

Pgp localization in RBE4-WT cells by indirect Pgp staining. RBE4 cells were seeded on coverslips and indirectly stained for Pgp after fixation. As assessed by confocal laser scanning microscopy Pgp (red) was located on the cell surface (arrowheads) of the RBE4-WT cells. Similar to the *MDR1*-EGFP-transduced RBE4 cells (Fig. 1A), no Pgp-positive intracellular vesicles were observed in the RBE4-WT cells. Cell nuclei were visualized by DAPI staining (blue).
