

Supplementary Figure 1. Spike recovery and Parallelism

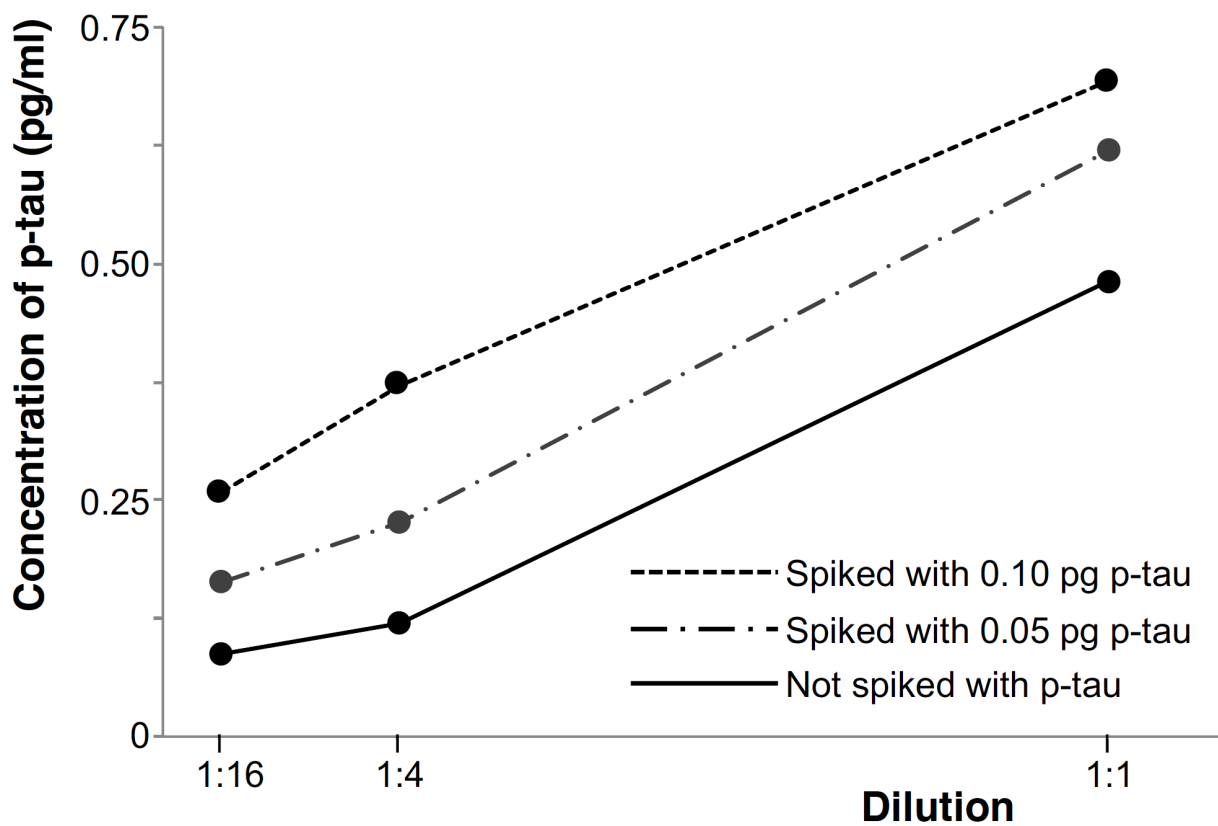

Figure legend for supplementary figure 1.

Three aliquots of the same plasma sample were spiked with 0 (solid line), 0.05 (one-dot chain line) or 0.10 (dotted line) pg of p-tau standard for a spike recovery experiment. Next, those 3 solutions were serially diluted 4-fold and 16-fold with sample diluent for analysis starting with non-diluted solution as the highest concentration to evaluate parallelism.
