SUPPLEMENTARY DATA

The altered transcriptome of pediatric myelodysplastic syndrome revealed by RNA sequencing

Lorena Zubovic, Silvano Piazza, Toma Tebaldi, Luca Cozzuto, Giuliana Palazzo, Viktoryia Sidarovich, Veronica De Sanctis, Roberto Bertorelli, Tim Lammens, Mattias Hofmans, Barbara De Moerloose, Julia Ponomarenko, Martina Pigazzi, Ricardo Masetti, Cristina Mecucci, Giuseppe Basso and Paolo Macchi.

Supplementary Methods

Patient material. For the RNA-seq analysis we used samples taken at the time of diagnosis from four pediatric patients with MDS and two control samples, containing three Refractory Anemia with Excess Blasts (MDS EB-1, P1, P2 (monosomy, -7) and P4), one MDS EB in transformation (MDS EB-2, P3) and two non-neoplastic pediatric control samples (C1 and C2). All 4 PMDS patient samples were obtained from the Associazione Italiana di Ematologia e Oncologia Pediatrica (AIEOP). Two control samples were obtained from the Centro Ricerche Emato-Oncologiche (CREO). All RNA samples from PMDS patients and controls were obtained from the BM blood. Informed consent was obtained from their legal guardians, as part of sample collection by the European Working Organization Group (EWOG). Institutional review board approval was granted by the Comitato Etico per la Sperimentazione con l'Essere Umano (CESP) of the University of Trento.

To validate further ten DEGs, we analyzed RNA samples from six new patients: P5 (MDS EB-1) and P6 (MDS-EB1, monosomy -7) from the Associazione Italiana di Ematologia e Oncologia Pediatrica (AIEOP), B1, B2, B4 (MDS EB-1) and B4 (MDS EB-2) obtained from Department of Pediatric Hematology-Oncology and Stem Cell Transplantation, Ghent University Hospital, Belgium. All RNAs were obtained from the BM blood (**Supplementary Figure S6A**). For the patients P5 and P6 informed consent was obtained from their legal guardians, as part of sample collection by the European Working Organization Group (EWOG). For the B1, B2, B3 and B4 informed consent was obtained from their legal guardians, as part of sample collection by the Department of Pediatric Hematology-Oncology and Stem Cell Transplantation, Ghent University Hospital, Belgium.

RNA sequencing. IlluminaHiSeq 2500 (Illumina, Inc., San Diego, CA, USA) was used for the sequencing process. Briefly, Ribosomal RNA depleted strand-specific RNA libraries were generated with the TruSeq Stranded Total RNA HT sample preparation kit with Ribo-Zero Gold starting from 500ng of total RNA.rRNA-depleted RNA recovered was fragmented for 4 min and processed in a random-primed, first-strand cDNA synthesis, followed by second strand cDNA (dUTP-marking) synthesis using DNA Polymerase I and RNaseH. A single 'A' base was added to these cDNA fragments and, in a subsequent ligation, Illumina-specific barcoded sequencing adapters were incorporated. The products were purified and enriched with PCR to create the final cDNA library. Each individual library was quantified, and quality controlled using QubitFluorometer (Thermo Scientific), LabChip GX (Perkin Elmer). After libraries equimolar pooling, the final pool was quality checked again with Qubit, LabChip GX and qPCR (KAPA and BIORAD). The adaptor-tagged pool of libraries was loaded in the Illumina Hiseq2500 for cluster generation and sequencing. 50 bp paired end reads were generated for all samples.

Computational analysis. For every sample, at least 80 million reads were sequenced. Raw sequence files were subjected to quality control analysis using FastQC (v 1.3) (Web reference 4). Gene quantification was conducted using two different methodologies: STAR (v2.5.3a) (13) (assigned to a gene using the GENCODE annotation (v27) (**Supplementary reference 1**) using the STAR function "quantModeGeneCounts" (**Supplementary reference 2)** and SALMON (**Supplementary reference 3**) both mapped to the human genome version GRCh38. Salmon performs transcript-level quantification estimates from RNA-seq data; it achieves its accuracy and speed via a number of different innovations, including the use of quasi-mapping (an accurate but fast-to-compute proxy for traditional read alignments) and a two-phase inference procedure that makes use of massively-parallel stochastic collapsed variation inference. Reads are mapped over exons by STAR/HT-SEQ COUNT pipeline and are proportionally assigned to the human transcripts by SALMON pipeline. Read counts generated by STAR were analyzed by using the DESeq2 package (**Supplementary reference 4**) for detecting genes that were differentially expressed. An adjusted p-value cut off of 0.05 was decided as threshold for detection of DEGs. Similarly, read counts generated by SALMON were analysed using edgeR, and applying the same cutoffs. Genes with absolute log2 fold change (FC) >1 and false discovery rate (FDR) <0.05 were considered to be differentially expressed. Starting from the SALMON expression matrix, genes that were considered as differentially expressed were analyzed using hierarchical clustering method (Cluster 3.0, (Web reference 6). Visualization of the clustering and heatmap of log2-normalized values were obtained using Java Treeview. Gene set enrichment analysis was performed starting from the common DEGs, using fgsea package, performing 10000 permutations and using as database the combination of the Reactome dataset (human profile, accessed in January 2018, from fgsea package) and the Molecular signature database (msigdb, V6), a comprehensive knowledge base for gene

sets (**Supplementary reference 5**). For the functional annotations analyses we used the Enrichr web tool (**Supplementary reference 6**). The enriched annotation table results obtained were then downloaded to be processed and visualized using the ggplot2 packages. The Cancer Genome Atlas (TCGA) gene expression data and the GTEX data were obtained via the GDC data portal hub (https://portal.gdc.cancer.gov/, last accessed July 2019) and integrated with our data using the COMBAT algorithm (**Supplementary reference 7**). To explore the high-dimensional property of the Integrated data we used the non-linear dimensionality reduction algorithm t-SNE (t-Distributed Stochastic Neighbor Embedding) https://github.com/jkrijthe/Rtsne. To evaluate the peculiar properties of the DEGs against the TCGA and GTEX dataset, we used GEPIA2 web tool using standard parameters (**Supplementary reference 8**). We also integrated our results with the LPEseq method (**Supplementary reference 9**). Since it starts from the raw counts, we applied LPE-seq in parallel to the Salmon quantifications and HT-seq derived counts. Since the LPEseq table results of the differential analysis does not include an actual estimation of the fold change but only the log2 means of the two groups, we used the difference between them as log fold change. In order to compare in a proper manner the differential gene lists, we decided to employ a concordance strategy using the correspondence at the top (CAT) plots. To create the CAT plot (**Supplementary reference 10**), we ranked genes by log fold change using the all four lists (LPEseq_HTSEQ, LPEseq_SALMON, SALMON_pipeline and EDGER_pipeline). We then created lists of candidate genes for a range of list sizes. CAT curves show the proportion of genes in common plotted against the size of the lists. The correlations were much higher (30% higher on average) in LPEseq_STAR_vs_STAR_pipeline and in LPEseq_SALMON_vs_SALMON_pipeline compared to our original comparison STAR_pipeline_vs_SALMON_pipeline

For the integrative analysis, we retrieved RNA-seq gene expression values (FPKM) from 36 pediatric patients with MDS, previously sequenced in *Schwartz JR et al., 2017* (3). To remove batch effects, the integration of the datasets was performed with the ComBat algorithm.

Droplet Digital PCR. Droplet Digital PCR (ddPCR) was performed according to the manufacturer's protocol. Briefly, 5ng of cDNA from each sample were added to the reaction tube. 20 µg of the mixture were loaded into a sample well of a DG8™ Cartridge for QX200 Droplet Generator followed by 70 µg of Droplet Generation Oil for Probes into the oil wells. The droplets were carefully transferred into a clean 96-well plate, sealed with the PX1 PCR Plate Sealer and put in the thermal cycler (QX200 Droplet Reader). QuantaSoft™ Software was used to set up a plate layout according to the experimental design. The automatic threshold applied to the 1-D or 2-D amplitude data was modified by establishing threshold manually. The relative expression value of each of DEG was calculated as the ratio between the droplet numbers for the studied gene and the two reference genes, Succinate Dehydrogenase Complex Flavoprotein Subunit A (*SDHA*) and Hypoxanthine Phosphoribosyltransferase 1 (*HPRT1*).

Statistical analysis. Statistical significance for droplet PCR concentrations (molecules/microliter) was tested with one-tailed t-test, unequal variances (*P<0.05, **P<0.01, ***P<0.001). The overall agreement between droplet PCR and RNA-seq fold changes was measured using the Pearson correlation coefficient.

Supplementary Figure Legends

Supplementary Figure SF1

A) Clinical characteristics of the patients enrolled in the study. **B)** Overview of the pipeline followed in this work. **C)** Gene expression scatterplot: example comparison of a sample gene expression performed with an alignment program (STAR) and pseudo-alignment program (SALMON). Interestingly, even if the correlation is high, some differences are present, especially for the low-intensity signals. Significantly enriched pathways were identified, four of which are related to the immune system: neutrophil degranulation, FCERI signaling, DAP12 interactions and DAP12 signaling. **D)** Correlation heatmap of the samples based on the expression obtained with SALMON and STAR. We observed that the samples could be grouped in pairs. **E)** Concordance at the top (CAT) plot of the log fold change (LFC). Starting from the four LFC lists form, LPEseq_HTSEQ, LPEseq_SALMON, SALMON_pipeline and EDGER_pipeline that were compared in pairs. The curves represent at each position (rank) in the DEG analysis the concordance value of two lists. **F)** Comparisons of the functional annotation scores in four different pipelines. We observe the density of the scores in the diagonal, in the upper part their correlation values in pairs, and in lower part the scatter plot in pairs. **G)** The heatmap of the subset of Gene Ontology score, in a simple color code: white if less than 2 (not significant), in green if less than 10 and greater than 2, and in red if greater than 5.

Supplementary Figure SF2

A) Functional Analysis: left panels: bar-plots representing the combined score, as defined in the Enrichr tool, for the GO terms significantly enriched for the upregulated (red) and downregulated (blue) genes; right panels: network map of the ontology terms from the Human Phenotype Ontology (HPO). An extensive investigation of GO and UniProt has shown that the majority of the 291 DEGs identified were previously reported to play roles in various biological processes and cellular pathways: ribosome dysfunction, inflammation, innate and adaptive immunity, oxygen transport, regulation of T-cell anergy, apoptosis and cell cycle, DNA recombination and glycolysis. **B)** T-distributed Stochastic Neighbor Embedding (t-SNE) representation of PMDS, AML and normal samples, each color corresponding to a different class. Please note that some samples are so close to each other that are not distinguishable.

Supplementary Figure SF3

A) Principal Component Analysis plot of the DEGs in TCGA dataset and **(B)** GTEx dataset. DEGs profile divides tumors into three distinct groups: one group that corresponds to AML (arrowhead), another group that even though heterogeneous comprises Thymoma tumors and lymphoid neoplasm Diffuse Large B-cell Lymphoma, and a third group that includes solid tumors only. **C)** Bar plots representing the combined score, as defined in Enrichr tool, for the Drug Signature Database (DSigDB) and the Drug Matrix database for the DEGs.

Supplementary Figure SF4

A) Network analysis of DEGs in PMDS (upregulated in red, downregulated in blue) and associated with aberrant expression in adult MDS transcriptome datasets. **B)** Heatmap displaying significant overlaps between genes differentially expressed in PMDS and tissue specific expression profiles from the ARCHS4 collection (Web reference 3).

Supplementary Figure SF5

Scatterplot: comparison between RNA-seq and ddPCR analysis. Genes are classified as upregulated (red), downregulated (blue) and reference (grey) according to RNA-seq results. The Pearson correlation coefficient is provided. Linear regression is also shown.

Supplementary Figure SF6

A) Clinical characteristics of 6 new patients used for the validation studies. **B)** Boxplot: digital PCR analysis of twelve genes, comparing expression levels between controls and PMDS patients. For each gene, box-whisker plots of concentration values are shown. Genes are classified as upregulated (red), downregulated (blue) and reference (grey) according to the RNA-seq analysis. Significant changes in cDNA concentration between control and patients are highlighted (one-tailed t-test, corrected for unequal variances *p-value <0.05, **p-value <0.01, ***p-value<0.001). **C)** Scatterplot: comparison between RNA-seq and ddPCR analysis. Genes are classified as upregulated (red), downregulated (blue) and reference (grey) according to RNA-seq results. The Pearson correlation coefficient is provided. Linear regression is also shown.

Supplementary Figure SF7

Integrative analysis of the transcript levels of 10 DEGs with altered expression in PMDS (7 up-regulated, 3 down-regulated). Data are represented as mean +-SEM for each class of samples: CTRL and PMDS patients sequenced by us, MDS-EB, MDS-RCC, MDS/MPN and AML-MRC pediatric patients sequenced in (3). The observed alterations in expression are fully confirmed by the integrative analysis.
