

Sepsi d'Oc study
445 patients
Observational period: 230 patients
Interventional period: 215 patients

57 excluded patients (Prior renal failure,
death in the first 24 hours)

The present study
388 patients analyzed for factors associated with RRT
354 patients analyzed for factors associated with renal dysfunction

**90 patients
with RRT**

**298 patients
without RRT**

> 50% increase
in serum
creatinine
27 patients

≤ 50% increase in
serum creatinine
237 patients

34 (8.8%) excluded patients:
patients with no RRT and
without data concerning the
course of serum creatinine in
the first in the first 24 hours

**117 patients with
renal dysfunction**

**237 patients with no
renal dysfunction**
