

**Figure S3.** MVP expression is not regulated by exposure to drugs. **a** E0771 cells were cocultivated (C) or not (NC) with adipocytes and treated or not (NT) with DOX. Proteins were extracted just at the end of drug treatment (0h) or at indicated times after drug exposure. Immunoblots against MVP were performed. Tubulin is shown as a control for equal protein loading. **b** MDA-MB436 were exposed or not (NT) to the indicated drugs and proteins were extracted at indicated times after drug exposure. Tubulin is shown as a control for equal protein loading. The following drug concentrations were used : DOX (2  $\mu\text{g}/\text{mL}$ ), 5-FU (4  $\mu\text{g}/\text{mL}$ ), Paclitaxel (200  $\mu\text{M}$ ).
