

Figure S1 – CD40L expression is similar on monocytes and CD8⁺ T cells from Behçet’s disease patients. Percentages of CD8⁺CD40L⁺ T cells (A) and CD40L⁺ monocytes (B) were determined under basal conditions and after 3h stimulus with 1.5 μ M ionomycin and/or 25ng/mL PMA by flow cytometry in healthy controls (HC), inactive (iBD) and active Behçet’s disease (aBD) patients. No difference in CD40L⁺ surface expression was observed.
