

## Additional file 1: Correlations of RLR and DBR expression levels with IFN scores

**Additional figure S1:** Correlation between interferon (IFN) type I score and mRNA expression of 6 IFN inducible genes (IFIH1, DDX58, DDX60, DHX58, ZBP-1, IFI16) in CD14+ monocytes in patients with cSLE (n=23). The correlation coefficients ( $r$ ) and  $p$  values are shown. For correlations Spearman's  $\rho$  correlation test was used and to compare means the Mann–Whitney U test was used.
