Supplemental Methods

Definitions of baseline characteristics

Previous coronary artery disease (CAD) was considered in the presence of known CAD: history of myocardial infarction (MI), chronic typical exercise-induced angina pectoris, previous coronary revascularization (coronary artery bypass graft or percutaneous coronary intervention), or evidence of CAD in myocardial perfusion imaging (presence of fixed or reversible perfusion defects) or in coronary angiography.

Peripheral artery disease was defined as history of peripheral artery disease, known carotid stenosis, or arterial vascular surgery for aortic aneurysm.

Atrial fibrillation was defined as history of at least paroxysmal atrial fibrillation occurring more than once, or atrial fibrillation on preoperative electrocardiogram (ECG).

Complications

Sepsis was defined as a clinical syndrome with the presence of infection and clinical symptoms according to the International Sepsis Definitions Conference¹.

Stroke was defined as a new focal neurological deficit judged by treating physicians to be of vascular cause lasting > 24 hours.

Pneumonia was collected from the discharge diagnosis. If criteria of sepsis were fulfilled at diagnosis, sepsis was adjudicated instead.

Pulmonary embolism was collected from the discharge diagnosis.

Postoperative delirium was defined as delirium with onset within 7 days after surgery, collected from medical charts.

MACE Definitions

AMI was defined according to the criteria of the Fourth Universal Definition of Myocardial Infarction.² Only AMI after the screening period (after the third postoperative day) was considered as MACE. Arrhythmia (atrial fibrillation/flutter, supraventricular tachycardia, ventricular tachycardia) was considered clinically significant if requiring drug therapy or electrical cardioversion. The attending cardiologist diagnosed AHF based on clinical symptoms, physical examination, chest x-ray, B-type natriuretic peptide or N-terminal pro B-type natriuretic peptide blood concentrations, and echocardiography, in line with current heart failure guidelines.³ Deaths were classified as cardiovascular or non-cardiovascular according to recent guidelines.⁴ Deaths were assumed to be cardiovascular unless evidence of a clear non-cardiovascular cause was documented.⁴

Supplemental Results

Sensitivity analysis using all patients for whom an individual hs-cTn assay was available

Hs-cTnI

In these analyses, 3,927 patients submitted to 4,842 surgeries were included (**eFigure 1, eTable 6**). The incidence of overall PMI was 8.9% (95%CI 8-10%), PMI_{Infarct} was 2.6% (95%CI 2.2-3.0) and PMI_{Injury} was 6.3% (95%CI 5.6-7.0%). Hs-cTnI concentrations were above the 99th percentile (26 ng/L) in 8% of patients prior to surgery and in 16% after surgery.

Patients with overall PMI diagnosed by hs-cTnI had higher rates of mortality and MACE within 30 days (8% vs. 1% and, 15% vs. 3%, respectively) and 1 year (20% vs. 7% and, 23% vs. 7%, respectively) than patients without PMI ($P < 0.001$ for all analysis). Additionally, PMI_{Infarct} and PMI_{Injury} diagnosed by hs-cTnI were independent predictors of mortality and MACE within 30 days and 1 year after surgery (**eTable 7**).

Sensitivity analysis for MINS diagnosed by hs-cTnI

Among the 4,842 procedures included in the hs-cTnI analysis, the incidence of MINS was 12% (95%CI, 11-13%). Patients with MINS had higher all-cause mortality and MACE at 30 days (5% vs. 1.4% and 11% vs. 3%, $p < 0.001$) and one year (16% vs. 8% and 20% vs. 7%, $P < 0.001$) versus patients without MINS. MINS was also an independent predictor of mortality and MACE in 30 days and 1 year. (**eTable 8, eFigure 3**)

Hs-cTnT

For these analysis, 6,965 patients submitted to 8,659 surgeries were included (**eFigure 1, eTable 9**). The incidence of overall PMI was 16% (95%CI, 15-17%), PMI_{Infarct} was 3.7% (95%CI, 3.3-4.1) and PMI_{Injury} was 12.4% (95%CI, 12-13%). Hs-cTnT concentrations were above the 99th percentile (14 ng/L) in 50% of patients prior to surgery and in 63% after surgery.

Patients with overall PMI diagnosed by hs-cTnT had higher rates of mortality and MACE within 30 days (12% vs. 2% and 19% vs. 4%, respectively) and 1 year (26% vs. 9% and, 29% vs. 8%, respectively) than patients without PMI ($P < 0.001$ for all analysis). Additionally, PMI_{Infarct} and PMI_{Injury}, diagnosed by hs-cTnT were independent predictors of mortality and MACE within 30 days and 1 year after surgery (**eTable 10**).

Supplemental Tables

eTable 1. STROBE Statement—Checklist of items that should be included in reports of cohort studies.

	Item No	Recommendation	Page
Title and Abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstract.	3
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found.	3
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported.	5
Objectives	3	State specific objectives, including any prespecified hypotheses.	5-6
Methods			
Study design	4	Present key elements of study design early in the paper.	7
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection.	7-9
Participants	6	(a) Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up.	7,9
		(b) For matched studies, give matching criteria and number of exposed and unexposed.	-
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable.	7-10 Supplement
Data sources/measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group.	7-9 Supplement
Bias	9	Describe any efforts to address potential sources of bias.	9-10
Study size	10	Explain how the study size was arrived at.	7-10
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why.	8-10
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding.	9-10
		(b) Describe any methods used to examine subgroups and interactions.	10
		(c) Explain how missing data were addressed.	10
		(d) If applicable, explain how loss to follow-up was addressed.	9
		(e) Describe any sensitivity analyses.	10
Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—e.g. numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analyzed.	11 and Supplement
		(b) Give reasons for non-participation at each stage.	supplement
		(c) Consider use of a flow diagram.	supplement
Descriptive data	14*	(a) Give characteristics of study participants (e.g. demographic, clinical, social) and information on exposures and potential confounders.	24(Table 1)
		(b) Indicate number of participants with missing data for each variable of interest.	11,24 supplement
		(c) Summarise follow-up time (eg, average and total amount).	11,12
Outcome data	15*	Report numbers of outcome events or summary measures over time.	11,12, Figures 2,3

			Supplement Table 5
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included.	11,12 Tables 3,4 supplement
		(b) Report category boundaries when continuous variables were categorized.	-
		(c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period.	-
Other analyses	17	Report other analyses done—e.g. analyses of subgroups and interactions, and sensitivity analyses.	12 supplement
Discussion			
Key results	18	Summarise key results with reference to study objectives.	13
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias.	14,15
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence.	13,14
Generalizability	21	Discuss the generalizability (external validity) of the study results.	14,15
Other information			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based.	1,2
