**Electronic Supplementary Material Table S1.** Search strategy conducted in January 2013 of MEDLINE via PubMed, Scopus, Science Citation Index (SCI) via Web of Knowledge, and SPORTDiscus via EBSCOhost limited to papers published post-1990

Theme	Keywords	Mesh terms (PubMed only)
Young people	Children, child, childhood, adolescence, adolescent, teen, teens, teenaged, teenager, teenagers, "young people", youth, youths, boy, boys, girl, girls, "school aged",	"Child", "Adolescent"
Physical activity	"physical activity", "physical activities", exercise, "energy expenditure", sport, sports, "active travel", ("leisure time", AND, activity),	"Motor Activity", "Sports", "Exercise", "Physical Exertion"
Objective measures	Accelerometer, accelerometry, accelerometers, "counts per minute", CPM, triaxial, Actigraph, Yamax, Actiheart, Omron, sensewear, caltrac, walk4life, ideaa, actireg, lifecorder, tritrac, genea, stepwatch, actical, actiwatch, rt3, activpal, actimarker, dynaport, CSA, MTI, pedometer, "heart rate", pedometry, pedometers, uniaxial, actigraphy,	"Monitoring, Ambulatory", "Actigraphy"
Time-segments	Hour, hours, hourly, day, days, daily, week, weeks, weekly, morning, afternoon, evening, weekday, weekdays, weekend, school, "break time", "play time", recess, lunchtime	

Themes were combined using AND, keywords were combined using OR. There were no language limitations enforced.

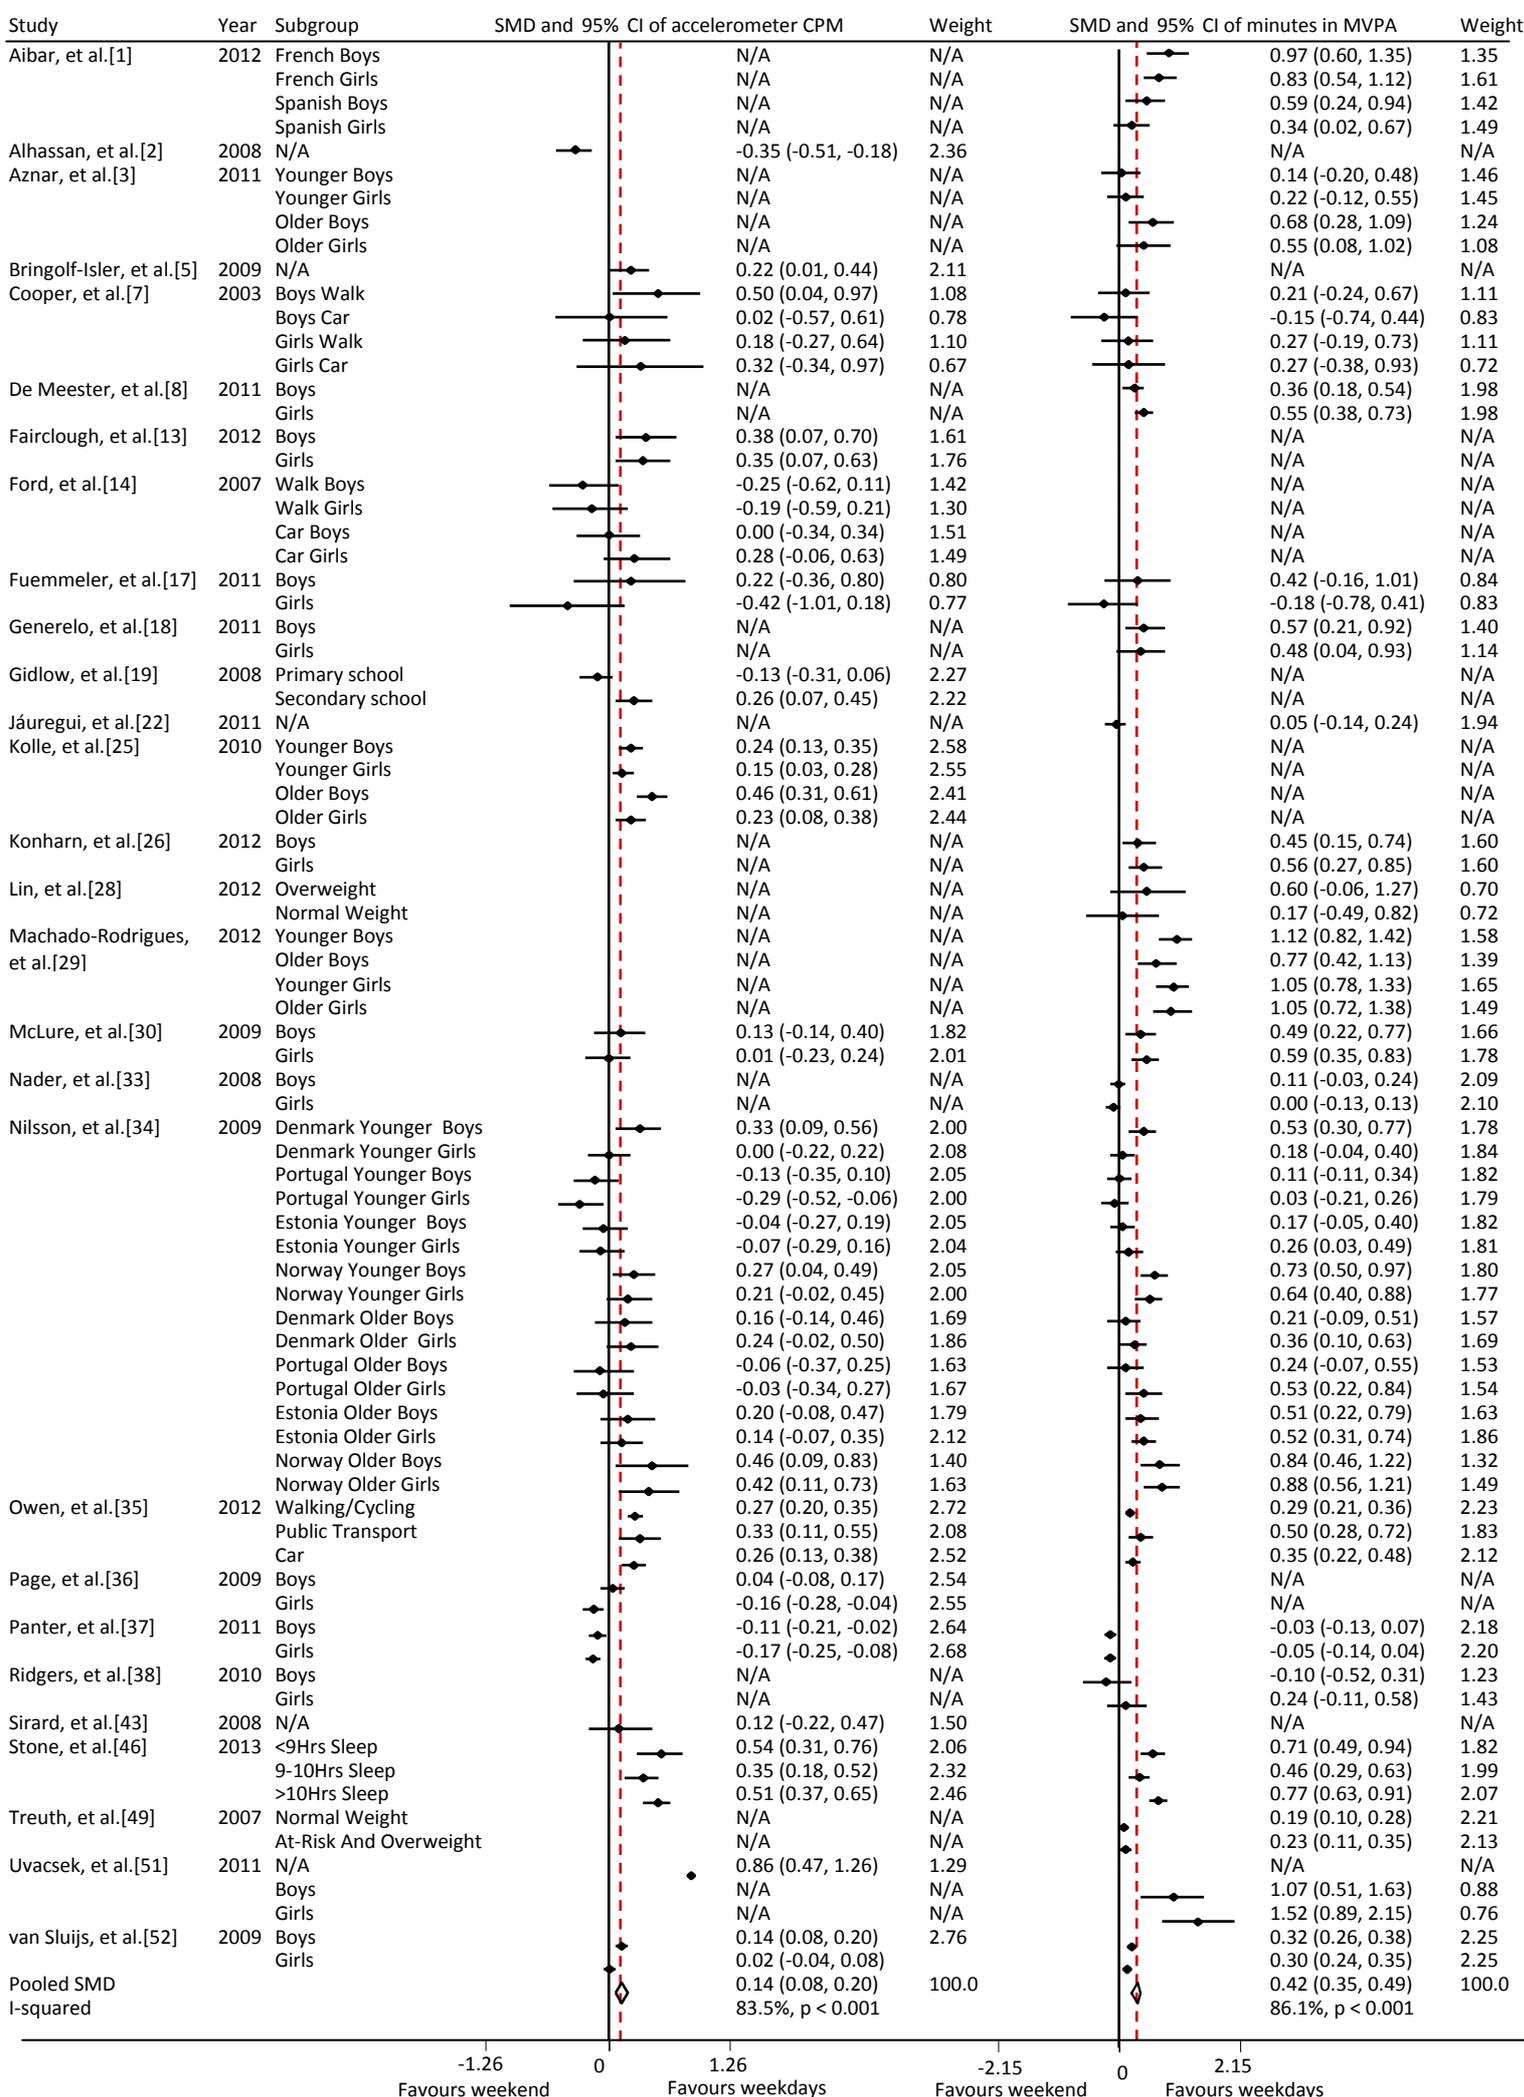

**Electronic Supplementary Material Table S2.** Study by study descriptive characteristics

Study	Year	Study name	Country	Sample size	Age (years)	Ethnicity	SES	Meta-analysed	Accelerometer	Epoch length (seconds)	MVPA cut-point (cpm <sup>a</sup> )	Minimum registered activity for inclusion (minutes)	
												Week days	Weekends
Aibar, et al.[1]	2013	EPAPA	France and Spain	301	14 to 15		Low to medium	Yes	Actigraph, GT3X	15	2296	600	480
Alhassan, et al.[2]	2008	GEMS	USA	293	8 to 10	Majority other than white - African American	Low	Yes	Actigraph, model not stated	60	3000	585	330

<sup>a</sup> If cut-point was reported per epoch length the per minute equivalent was calculated. NR, not reported; NA, not applicable eg. study only measured physical activity on weekdays; SES, socioeconomic status; MVPA, moderate-to-vigorous intensity physical activity; CSA, computer science applications; MTI, manufacturing technologies Inc, <sup>b</sup> valid after-school period; <sup>c</sup> reported as Metabolic equivalents as this was the measure reported by the monitor, <sup>d</sup> at least one day of seven with 360 minutes of data was required

**Electronic Supplementary Material Figure S1.** Forest plots showing standardised mean differences (SMD) and 95% confidence intervals (CI) between week day and weekend day physical activity measured by accelerometer in average counts per minute (CPM) and minutes in moderate-to-vigorous intensity physical activity (MVPA). SMD is reported in units of standard deviation; 0.2, 0.5 and 0.8 respectively represent small, moderate and large effects.  $I^2$  is a measure of heterogeneity between studies.

**Electronic Supplementary Material Figure S2.** Forest plots showing standardised mean differences (SMD) and 95% confidence intervals (CI) between in-school and out-of-school physical activity measured by accelerometer in average counts per minute (CPM) and minutes in moderate-to-vigorous intensity physical activity (MVPA). SMD is reported in units of standard deviation; 0.2, 0.5 and 0.8 respectively represent small, moderate and large effects.  $I^2$  is a measure of heterogeneity between studies.

**Electronic Supplementary Material Figure S3.** Forest plots showing standardised mean differences (SMD) and 95% confidence intervals (CI) between out-of-school and weekend physical activity measured by accelerometer in average counts per minute (CPM) and minutes in moderate-to-vigorous intensity physical activity (MVPA). SMD is reported in units of standard deviation; 0.2, 0.5 and 0.8 respectively represent small, moderate and large effects.  $I^2$  is a measure of heterogeneity between studies.

TPA, total physical activity; MVPA, moderate-to-vigorous intensity physical activity; B Coef, Beta Coefficient; 95% CI, 95% Confidence interval; Ref, reference category. Bold p - values indicate a significant association of the potential effect modifier (age, gender, and global region of study setting) with the standardised mean difference in physical activity between time-segments. Significantly factors were combined in a multivariate model where appropriate (**Electronic Supplementary Material Table S3b**). Adjusted R-squared indicates the proportion of between-study variance explained by the covariates. Negative adjusted R-squared indicates that the covariates explain less of the heterogeneity than would be expected by chance. In several models global region 'Other' was omitted due to co-linearity.

**Electronic Supplementary Material Table S3b.** Summary of results of meta-regression analyses in multivariate models

		B Coef.	95% CI		P - value	Adjusted R-squared (%)	P-value for joint test of all covariates
