* Case report was defined as 1 patient; Case series, ≤ 10 patients; Cohort, >10 patients.

† Only the number of patients with triple or quadruple cervical artery dissection is provided, () indicates which of these patients were included in the current study. The original publication may describe additional patients.

‡ The corresponding author no longer had data available for the remaining 8 patients for which there was insufficient individual patient data available in the publication.

§ In the original publication 14 patients with triple or quadruple cervical artery dissections were reported. However, the corresponding author explained that only 8 presented with simultaneous triple or quadruple cervical artery dissections. One of these 8 patients was already described in the case report by Oehler et al (2003) and was therefore excluded.

§§ In the original publication 7 patients with triple or quadruple cervical artery dissections were reported. However, the corresponding author explained that upon further review there were only 6 patients, not 7 as stated in the paper.
