

Supplementary Table 2 Topical antibiotics that preceded corneal sampling for culture and sequencing in 16 episodes of microbial keratitis

Topical antibiotics	Patients (n=16)
Fluoroquinolones	2
Chloramphenicol	6
Fusidic acid	2
Fluoroquinolones and chloramphenicol	2
Other ^a	4

^a One patient was initially treated with a combination of fluoroquinolones and chloramphenicol that was later adjusted to vancomycin and ceftazidime, two patients received oxytetracycline in combination with hydrocortisone, and one patient was pretreated with a combination of fluoroquinolones, tobramycin, and chloramphenicol. Ten patients discontinued treatment 12–96 h prior to sampling, five did not, and for the remaining patient information on treatment continuation/discontinuation was missing.
