TABLE S3: Raw data of vaccinees with low MV-IgG ELISA responses. IgG UI/ml (Enzygnost), fold from cutoff and OD at 450 nm for each BW:FcγR- ζ reporter cell assay and serum dilution for 50% PRNT of the different sera tested for specific MV IgG are listed. Borderline values for Elisa were set if ≥ 0 and ≤ 320 . Positive values were set if ≥ 1 for each BW:FcγR- ζ assay and ≥ 0.200 for neutralization. Samples were measured in triplicates.
