# Manufacturer's cut off value																	

TABLE S4: Raw data of individual human sera. IgG U/ml (LIAISON), serum dilution for 50% PRNT, fold from cut off, OD at 450 nm and standard deviations for each BW:FcyR- ζ reporter cell assay and of the different sera tested for specific HCMV IgG are listed. Positive values were set if ≥ 0.3 for ELISA, ≥ 1 for each BW:FcyR- ζ assay and ≥ 6 for neutralization. Positive and negative results are separated by a bold line. Results highlighted in bold were below the value defined as positive for that particular assay in the case of the positive samples or above the value defined as negative for that particular assay in the case of the negative samples. Samples were measured in triplicates. The totality of the samples was measured in three independently performed sub experiments (1, 2, 3), resulting in different cut off values as indicated.
